

VI. BEHAVIORAL RISK FACTOR SURVEY

The Franklin County Behavioral Risk Factor Survey is a randomly selected, representative sample of the residents of the county. The survey that was used is a telephone interview format, modeled after the Behavioral Risk Factor Survey conducted by the Centers for Disease Control. The survey collects information from adults on health behaviors and preventive practices related to several leading causes of death such as chronic diseases, injury, and HIV infection. The overall statistical reliability of the survey is a confidence level of 90, plus or minus 6%.

Adults were randomly selected using random digit-dialed telephone surveys and were questioned about their personal health practices. In addition, they were asked to rate various community health issues. A Likert scale was utilized, asking respondents to identify issues as a definite problem, somewhat of a problem, not a problem, or not sure. A sample size of approximately 200 was collected from Franklin County. *Issues recognized as potential problems are in bold and are denoted by asterisk.*

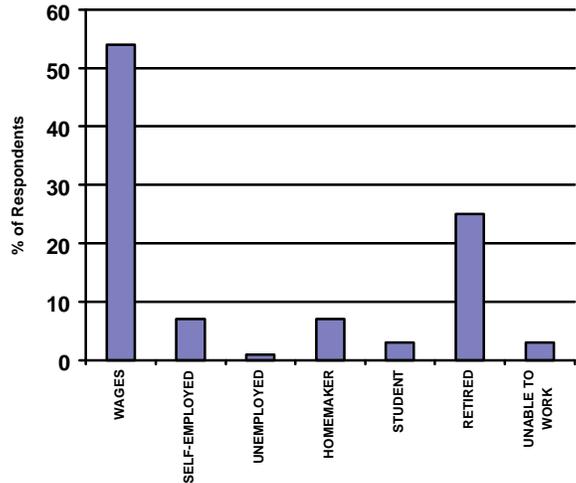

Behavioral Risk Factor Demographics

- Of the 204 respondents, 99 were male, 105 were female, of those 68% were married, 9% divorced, 14% widowed, and 8% never married.
