

Respondents were asked to rate the aspects of health care received. The following is the responses rating services Poor to Excellent – Good.

Chart 4
ASPECTS OF HEALTHCARE RECEIVED

2. Behavioral Risk Factor Survey (BRFS)

The BRFS is a randomly selected representative sample of the residents of the county. The survey that was used is a telephone interview survey modeled after the BRFS survey conducted by the Centers for Disease Control. The BRFS collects information from adults on health behaviors and preventive practices related to several leading causes of death such as chronic diseases, injury, and HIV infection.

Adults were randomly selected using random digit-dialed telephone surveys and are questioned about their personal health practices. In addition, they were asked to rate various community health issues. A Likert scale was used with respondents identifying issues as a definite problem, somewhat a problem, not a problem, or not sure.

A sample size of 199 was collected from Campbell County. This allowed estimates of risk factors to be made for the county. The overall statistical reliability is a confidence level of 90, ± 6%. Of the respondents, 53% were female and 47% male. This compares to 52% female and 48% male for the population of Campbell County based on the 1990 census (Chart 5).
